In PUNCTION: Component of the SCF (SKPI-CULI-F-box protein) E3

ubiquitin ligase complex, which mediates the ubiquitination and
subsequent proteasomal degradation of target proteins. Through the
RING-type zinc finger, seems to recruit the E2 ubiquitination
enzyme to the complex and brings it into close proximity to the
substrate. Required for the specific SCF-dependent proteolysis of
CI, but not that of ARM, suggesting that it also participates in
the selection of substrates inside the SCF complex.

--- PATHWAY: Ubiquitin conjugation; third step.
--- SUBUNIT: Part of a SCF complex consisting of Skpa (SKPI), Lin19
---- Inin19 and Slmb. Interacts directly with

-!- TISSUE SPECIFICITY: Widely expressed. Expressed in embryonic,
larval and adult tissues.
-!- DEVELOPMENTAL STAGE: Expressed both maternally and zygotically.
-!- DOMAIN: The RING-type zinc finger domain is essential for ubiquitin ligase activity. It coordinates an additional third zinc

regulation causes severe growth and developmental defects.";
J. Biol. Chem. 277:50699-50080(2002).
-!- FUNCTION: Potential component of the SCF (SKP1-CUL1-F-box protein)
B3 ubiquitin ligase complex, which mediates the ubiquitination and
subsequent proteasomal degradation of target proteins. The SCF
complex plays a crucial role in regulating response to auxin and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDLINE-22204438; PubMed-12215511;

SUBUNIT: Part of a SCF B3 ubiquitin ligase complex containing psh1, pipl, pcull and the F-box proteins popl and pop2. Instead of the popl/pop2 hetereodimer also homooligomers of popl or pop2 may be present in the complex.
SUBCELLULAR LOCATION: Nuclear and cytoplasmic.
DOMAIN: The RING-type zinc finger domain is essential for ubiquitin ligase activity. It coordinates an additional third zinc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FUNCTION: Component of B3 ubiquitin ligase SCF complexes, which mediate the ubiquitination and subsequent proteasomal degradation of target proteins. Seems to recruit the B2 ubiquitination enzyme. like UBC3/CDC34, to the complex and brings it into close proximity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SEQUENCE FROM N.A., FUNCTION, SUBCELLULAR LOCATION, AND INTERACTIONS WITH POPL? AND DCUL1.

The present sequence encodes a human ROC1 ring finger protein. The specification also describes human ROC2. ROC1 and ROC2 are similar to appecific about the APC complex. The proteins stimulate cullin dependent ubiquitin ligase activity. ROC1 functions in vivo as an essential regulator of CDK inhibitor Sic1 degradation by the SCF (undefined) pathway. ROC proteins are useful for screening bloactive agents that interfere with the binding of ROC proteins with cullin proteins. Pharmaceutical formulations comprising ROC proteins are useful for diagnostic and therapeutic purposes, preferably for diagnosing and

The present sequence is one of a large number of 5' ESTB derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTB were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTB are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTB are derived from mRNAs with inteact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTB are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion

The present invention describes an isolated tumour-associated antigenic target (TAT) nucleic acid comprising: (a) any of 4622 nucleotide sequences (see SEQ ID NO:1 to 4622); (b) the full-inapth coding region of (a); (c) the complement of (a) or (b); (d) a sequence that has 80% or (a); (c) the complement of (a) or (b); (d) a sequence that has 80% or (a) or (b); (d) a sequence that hybridises to (a).

CC sequence identity to (a)-(c); or (e) a sequence that hybridises to (a) a process for producing a polypeptide; (4) an isolated polypeptide (a) a process for producing a polypeptide; (4) an isolated polypeptide (c) a process for producing a polypeptide; (4) an isolated polypeptide (c) and amino acid sequence encoded by the full-comprising the above polypeptide (a) or (b); (5) a chimeric polypeptide (c) an isolated antibody that binds to the above polypeptide; (6) an isolated antibody that binds to the above polypeptide; (6) an isolated antibody that binds to the above polypeptide; (1) a composition of matter comprising the above polypeptide; (1) a composition of matter comprising the above polypeptide; (10) a composition of matter comprising the above polypeptide; (10) a composition of matter comprising the above polypeptide; (10) a composition of matter comprising the above polypeptide; (10) a composition of matter contained within the container; (11) an article of manufacture comprising a container and the containing effect of the above protein; (13) a method of containing the containing a method of containing the prowth of the cell is at least in part (dependent upon a growth containing a method of containing the above protein; (13) a method of deferentiating a manufacture comprising a method of the cell is at least in part (dependent upon a growth containing a method of the cell is at least in part dependent and comprising a containing a c

presence of a protein in a sample suspected of containing the protein described above; (15) methods of diagnosing the presence of a tumour in a mammal; (16) a method for treating or preventing a cell proliferative disorder associated with increased expression or activity of the above protein; and (17) a method of binding an antibody, oligopeptide or organic molecule to a cell that expresses the protein described above. The TAT sequences have cytostatic activities, and can be used in gene therapy. The composition and methods are useful for diagnosing, preventing or treating cancer. The composition is also used for preparing a medicament for the therapeutic treatment or diagnostic detection of a cell proliferative disorder or cancer. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                               human TAT cDNA sequence from the present invention.

preventing or treating cell proliferative disorders such as cancer nucleic acid molecule and encoded polypeptide, for diagnosing

Claim 1; SEQ ID NO 1695; 5504pp; English.

The present invention describes an isolated tumour-associated antigenic target (TAT) mucleic acid comprising; (a) any of 4622 nucleotide sequences (see SEQ INO: 1 to 4622); (b) the full-length coding region of carget (TAT) mucleic acid comprising; (a) any of 4622 nucleotide sequence identity to (a) -(c); or (e) a sequence that hybridises to (a) -(c). Also described: (l) an expression vector comprising the above expression vector; (3) a process for producing a polypeptide; (4) an isolated polypeptide occupation; (a) an amino acid sequence encoded by any of the above comprising the above expression vector; (3) a comprising the above polypeptide (b) an amino acid sequence encoded by the full-comprising the above polypeptide (sequence encoded by any of the above comprising the above polypeptide fused to a heterologous polypeptide; (6) an isolated antibody that binds to the above polypeptide; (6) an isolated antibody that binds to the above polypeptide; (6) an isolated antibody that binds to the above polypeptide; (10) a tumour associated antipody (17) a process the above polypeptide; (9) a tumour associated antipodic target (17x) chinding organic molecule that binds to the above polypeptide; (10) a tumour associated antipody of antipody of a cell that expresses the above polypeptide or TAT binding organic molecule, and binds to the above polypeptide; (11) an article of manufacture comprising a container and composition of matter contained within the container; (12) mathods of matter contained within the container; (12) mathods of containing the protein; (13) a method of determining the presence of a tumour in a described above; (15) methods of diagnosing the presence of a tumour in a described above; (15) methods of diagnosing the presence of a tumour in a method for treating or preventing a cell protler associated with increased expresses the above protein; (14) and expresses the above protein; (15) a method of diagnosing the presence of a protein in a sample enspected of containing the above; (15) methods of diag preventing or treating cancer. The composition is also used for preparing a medicament for the therapeutic treatment or diagnostic detection of a cancer. The present sequence represents a numan TAT cDNA sequence from the present invention. proliferative disorder or

The present sequence encodes a human cullin-interacting RING-H2 finger protein (Ring box protein), designated Rbx1. The polypeptide is a tumour suppressor. Rbx1 is useful for diagnosting a predisposition of a patient to certain carcinomas. It is also useful for treating Ring box protein associated carcinomas. It is also useful for treating Ring box protein animals. Rbx1 is also useful for evaluating the effectiveness of a therapeutic treatment for Ring box associated carcinomas. Rbx1 can be used to screen for agents which augment or inhibit the activity of other coullin-containing ubiquitin ligase and of the VHL (von Hippel- Lindau) complex controlling the conjugation of ubiquitin or ubiquitin-like proteins to various sets of target proteins. Carcinomas which may be treated include renal carcinomas, cereballar hemangioblastomas and hemangiomas, retinal angiomata and pheochromocytomas encoding a human cullin-interacting RING-H2 finger protein (Rbx1). Cullin interacting RING-H2 finger protein, a component of von Hippel-Lindau tumor suppressor complex and Skpl-Cdc53p-F-box protein (SCF) ubiquitin ligase, useful for diagnosing and treating Ring box protein "cullin-interacting RING-H2 finger protein Cullin-interacting RING-H2 finger protein; Ring box protein; Rbxl; tumour suppressor; carcinoma; Ring box associated carcinoma; von Hippel-Lindau complex; ubiquitin conjugation; renal carcinoma; cerebellar hemangiobastoma; hemangioma; retinal angiobata; 100.0%; Score 327; DB 3; Length 508; 100.0%; Pred. ```
TAT polypeptide; and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, varian cancer, liver cancer, bladder cancer, pancreatic cancer, ovarian cancer, liver cancer, bladder nervous system, melanoma and leukaemia. TAT nucleic acids may further be chromosome identification and in gene therapy. The present sequence represents a TAT nucleic acid of the invention

The invention relates to an isolated polymucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polymoleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for informance; in forensics, in assessing biodiversities, or in identifying mutations in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide for corresponding in the recombinant production of protein, or in generating antibodies specific for it. The present sequence is useful for generating antibodies specific for it. The present sequence is one of the 38043 isolated cDNA/EST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from 18770 at

                                                New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 133
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CTTTGAAGTGAAAAAGTGGAATGCAGTAGCCCTCTGGGCCTGGGATATTGTGGTTGATAA 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠે
                                                                                                                                                                                                                                                                                             The invention relates to a novel isolated polynucleotide and the encoded polypeptide. The molecules of the invention demonstrate antinflammatory, neuroprotective, antianaemic, cyrostatic and vulnerary activities and may be useful in preparing a composition for diagnosing or treating inflammatory, haematopoiettc, immune, neurodegenerative or stem cell disorders, such as aplastic anaemia or cancer, as well as for promoting wound healing. The molecules may also be utilised during gene therapy procedures. The current sequence is that of a human therapeutic DNA of the invention. The current sequence is not shown explicitly within the specification but can be accessed from the WIPO web-site.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated polypeptide (I) associated with breast cancer which is encoded by a nucleic acid molecule comprising a nucleotide sequence (SI). Further disclosed is an antibody that binds to the polypeptide of the invention. The activity of the polypeptide of the invention. The activity of the polypeptide of the invention may be described as cytostatic. The antibody is useful for detecting the presence of (I) in a sample. Nucleic acid molecules of the invention are useful in the detection of breast tumours. (I) is useful as a marker for breast cancer and in breast cancer therapy. Sequences given in records ACNY9851-ACN92934 represent nucleic acid markers associated with breast cancer. Note: The sequence listing does not form part of the specification but may be obtained in electronic format from the USPTO web site at seqdata.uspto.gov/sequence.html?DocID=20030099974
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     970
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                182

This invention describes now accors; prokaryotic or entaryotic cells; produce recombinant expression vectors; prokaryotic or entaryotic cells; poly- or mono-clonal antibodies (Ab) specific; hybridomas that express monoclonal Ab; biosensor chips having an addressable sequence pattern as monoclonal Ab; biosensor chips having an addressable sequence pattern as probes; medical or diagnostic instruments that include the biosensor; for extracorporcal differential diagnosis of autoimmune diseases and proteins tubulins; dolichyl-diphospho-oligosacharide-glycosyl transferases and proteins. The autoantisosacharide-glycosyl transferases and proteins. The autointospho-oligosacharide-glycosyl transferases and proteins. The antibodies may be labelled conventionally with radioisotopes, coloured or fluorescent groups, or a member of the option, avidin pair, or colloidal gold. The autoantigens can be directed against mitochondria, liver-kidney microsomes; histidyl-tRNA; nuclear membrane, neutrophilin/cytoplasm; insect cells; epidermal intracellular cor basal membrane antigens; gold or cell nuclei, or associated with multiple sclerosis or rheumatoid arthritis. They are useful for epitope mapping; in affinity chromatography or electrophoresis; for diagnosis, produce biosensor chips or for autoantibody apheresis.

C autoantigen DNA can be used for therapeutic response of autoimmune diseases; to produce biosensor chips or far autoantibody apheresis.

C autoantigen DNA can be used for therapeutic RNA interference against autoantibodies. Blochips that carry the new materials are useful in medical and diagnostic instruments. AD092020-AD092280 represent human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human DNA autoantigens, useful as assay, diagnostic, and prognostic reagents and for treating autoimmune disease, also related expression products and antibodies with similar uses.

```
The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether proteiner is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer; (b) monitoring the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) assessing the prostate calc cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (d) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                  300

                                                                                                                                                                                                                                                                                                                                                                                                                                                        61
                                                                                                                                                           Composition useful for diagnosis of conditions, disorders or diseases associated with atherosclerosis, comprises several polynucleotides that are differentially expressed in foam cell development.
                                                                                                                                                                                                                         The present invention relates to the isolation of human polynucleotide sequences that are differentially expressed during foam cell differentiation. The polynucleotide sequences of the invention or a composition comprising these polynucleotides are useful as a high throughput method for detecting altered expression of one or more polynucleotides in a sample. The polynucleotides can be used in the diagnosis of disorders associated with foam cell development such as atherosclerosis, cerebral stroke, and cardiovascular disorders such as coronary artery disease. The polynucleotide sequences can also be used both primers and probes. The polynucleotides of the invention are also useful in gene therapy. AAS94746-AAS59021 represent the human polynucleotide sequences of the invention which are differentially

Disclosure; SEQ ID NO 9; 209pp; English

The present invention describes a method for identifying an agent for treating a diabetic or pre-diabetic individual. The method comprises contacting an agent to a mixture comprising a polypeptide encoded by a nucleic acid that hybridises under stringent conditions to a nucleic acid condition, and selecting an agent that modulates the expression or excivity of the polypeptide. Also described: (1) a method of treating a diabetic animal, comprising administering to the animal a comprising introducing an expression cassette into a cell, comprising introducing into the cell an expression cassette comprising a promoter operably linked to a polynucleotide encoding a polypeptide, where the polynucleotide hybridises under stringent conditions to a nucleic acid encoding the above amino acid sequences; and (3) a method of diagnosing an individual who has Type 2 diabetes or is pre-diabetic, comprising detecting in a sample from the individual the level of the above-mentioned polynucleotide encoding control or the polypeptide or the level of the above-mentioned polynucleotide encoding control or polynucleotide in the sample compared to a level of the polypeptide or conditions in diadrates that the individual is diabetic or pre-diabetic. The method is useful in diagnosing and treating diabetes, insulin resistance or related metabolic diseases in human subjects. The method may also be

Sequence 35025 Application US/10242535A

Publication No. US20040013663A1

GENERAL INFORMATION:

APPLICANT: Chondrodene Inc.

APPLICANT: Chondrodene Inc.

TITLE OF INVENTION: Compositions and Methods Relating to Osteoarthritis

FILE REPREMENT: 42005

CURRENT APPLICATION NUMBER: US/10/242,535A

CURRENT FILING DATE: 2002-09-12

PRIOR APPLICATION NUMBER: US 60/305,340

PRIOR FILING DATE: 2001-07-13

PRIOR FILING DATE: 2001-07-13
